AB In this study soybean oil triglycerides were reacted with maleic
anhydride
in an ene reaction to introduce more than two maleate residues
per triglycerides. The maleated soybean oil (SOMA) was then polymerized
with
diols to the half-ester stage only. Two different
types of alcs. was used in this work:.. (1) Short-chain
polyhydroxy linear or cyclic alcs. having 2, 3, 4, or 6 hydroxyl
groups; and (2) long-chain dihydroxy alcs. The aim was to determine
the effect of functionality and chain length by choosing alcs.
with increasing number of hydroxyl groups and different chain lengths.
The
reaction of alcs. with anhydride functionalized soybean oil to
give a polymeric half-ester is a reaction that proceeds without
the formation of byproducts and is different from complete
polyesterification of maleated oils, which are well known. To improve
the
reaction yields, different catalysts and different reaction conditions
were examined The structural anal. of the products was done with 1H-NMR
and
IR spectroscopy. All of the new polymers obtained were resilient and
soft
rubbers at room temperature Castor oil polymer mixed with 60% CaCO3 and
12%
cork powder gave a resilient and nontacky linoleum composition

AB Conducting metalized polymer films were prepared via a) treating
poly(vinyl
alc.)-AgNO3 chelate films with doping agents and b) reduction of treated
films
by a NaBH4 aqueous solns. Good elec. conductivity and long-term film
stability were
obtained for these polymer systems. Crystal structure of the polymers
was
also studied by x-ray diffraction. The preparation of
polyacrylonitrile-AgNO3
complex films was also studied.
